I build full-stack products and tools for evaluating AI systems

Experience

QuinStreet | Software Engineer

Jun 2026 - Present | San Francisco, CA

- Built an incident-analysis pipeline that groups production errors and grounds model analysis in source files. It runs in dev and stage while observing production data.
- Designed and shipped a consent-state workflow with idempotent capture, transactional audit records and post-commit notification handling.

QuinStreet | Software Engineer Intern

Jun 2025 - Jun 2026 | San Francisco, CA

- Co-architected the platform and built multi-step onboarding with address autocomplete, dependent vehicle selection and policy-document import.
- Built the rating engine in Java and Spring Boot to connect the product's insurance workflow to rate APIs.

DeepTek Medical Imaging | Software Engineer Intern

Jun 2023 - Jan 2024 | Mumbai, India

- Built health-record exchange APIs and interfaces in Node.js, React and MySQL, standardizing records around FHIR resources.
- Improved service responsiveness with query optimization and Redis caching, and added structured logging and distributed tracing.

Selected Projects

FaultLab | September 2026 | local evaluation lab

A team-built, AI-assisted lab for testing LLM agents under tool failures, with fixed-code checks and fresh challenges before a proposed repair can replace the baseline.

Algorithmic Options Trading System | 2023-Present | strategy tooling

Live execution was disabled in recorded sessions. This Python and React tooling encodes a trader's method, keeps uncertain order state explicit and has a public engineering write-up.

CodebaseQA | January-August 2026

Codebase exploration with source-cited answers, guided learning and an interactive dependency graph, built around repository code instead of architecture guesses.

Education

University of Southern California | Master of Science, Computer Science

Completed the M.S. in Computer Science in May 2026.

Selected Skills

Languages: Python, Java, C++, TypeScript, JavaScript

AI & LLM: OpenAI API, Anthropic Claude API, RAG, Vector Search, Tool Calling

Backend: Spring Boot, Spring WebFlux, FastAPI, Node.js, Express

Frontend: React, Next.js, Tailwind CSS, Zustand, React Flow

Data: PostgreSQL, MySQL, Redis, Elasticsearch, ChromaDB

Testing: pytest, JUnit, Vitest, Playwright, Mutation Testing

Selected Awards

I led a team to third place out of more than 90 teams at HackMIT-WPU in Pune. CORDON placed first out of 37 teams at AGI House's Agent Identity Build Day.
